

# CERTIFICATION

AOAC Research Institute  
*Performance Tested Methods<sup>SM</sup>*

Certificate No.  
**070202**

The AOAC Research Institute hereby certifies the method known as:

**BAX® System PCR Assay for *Listeria monocytogenes***  
**BAX® System X5 PCR Assay for *Listeria monocytogenes***

manufactured by

Hygiena  
2 Boulden Circle  
New Castle, DE 19720 USA

This method has been evaluated in the AOAC Research Institute *Performance Tested Methods<sup>SM</sup>* Program and found to perform as stated in the applicability of the method. This certificate indicates an AOAC Research Institute Certification Mark License Agreement has been executed which authorizes the manufacturer to display the AOAC Research Institute *Performance Tested Methods<sup>SM</sup>* certification mark on the above-mentioned method for the period below. Renewal may be granted by the Expiration Date under the rules stated in the licensing agreement.

*Scott Coates*

<b>METHOD NAMES</b>		
BAX® System PCR Assay for <i>Listeria monocytogenes</i> and BAX® System X5 PCR Assay for <i>Listeria monocytogenes</i> Formerly DuPont™ BAX® System PCR Assay for <i>Listeria monocytogenes</i>		
<b>INDEPENDENT LABORATORY</b>		
R-Tech Laboratories P.O. Box 64101 St. Paul, MN 55164-0101		
<b>APPLICABILITY OF METHOD</b>		
Target organism – <i>Listeria monocytogenes</i> .		
Matrixes – (25 g) – chocolate ice cream, milk (2%), vanilla yogurt, apple juice, cabbage slaw, fish sticks, frankfurters, langostinos, orange juice, peas, pepperoni, spinach, strawberries, Surimi, deli turkey, ground pork, queso fresco, plastic (4x4 in)		
Performance claims – Method performs equivalent or better than reference method.		
<b>ORIGINAL CERTIFICATION DATE</b>		
July 24, 2002		
<b>CERTIFICATION RENEWAL RECORD</b>		
Renewed annually through December 2024.		
<b>METHOD MODIFICATION RECORD</b>		
1. July 2013 2. December 2015 Level 2 3. March 2017 Level 1 4. December 2017 Level 1 5. May 2019 Level 1 6. December 2019 Level 1 7. November 2022 Level 1 8. December 2023 Level 1		
<b>SUMMARY OF MODIFICATION</b>		
1. Addition of Thermal Block for automated sample lysis. 2. Certified use of BAX® X5 with kit. 3. Name change from DuPont Nutrition & Health to Qualicon Diagnostics LLC., a Hygiena company. 4. Update inserts, manuals, and labels to Hygiena. 5. Editorial updates to inserts and corporate address change. 6. Editorial/Clerical changes. 7. Editorial/Clerical changes. 8. Editorial/Clerical changes.

<b>PRINCIPLE OF THE METHOD (1)</b>		
The BAX® System uses the Polymerase Chain Reaction (PCR) [2] to amplify a specific fragment of bacterial DNA, which is stable and unaffected by growth environment. The fragment is a genetic sequence that is unique to <i>L. monocytogenes</i> , thus providing a highly reliable indicator that the organism is present. The automated BAX System then uses fluorescent detection [3] to analyze PCR product for positive or negative results. (The non-automated BAX system, which uses gel-detection methods, has already received AOAC-RI Performance Tested certification [4].)		
PCR offers the potential for rapid and definitive detection of <i>L. monocytogenes</i> [5], and has been demonstrated to be effective for other organisms [6, 7]. In order to realize this potential, however, some of the drawbacks of PCR must be overcome. The first of these is the complexity of the PCR procedure itself. The second is the potential for false positives due to contamination with one or more molecules of amplified PCR product in the laboratory. This most often happens during the many pipetting steps associated with traditional PCR. The BAX System with automated detection alleviates these drawbacks by combining the reagents needed for the PCR process into a stable, dry, manufactured tablet already packaged inside the PCR tubes. After amplification, these tubes remain sealed for the detection phase, thus significantly reducing the potential for contamination.		
The BAX System combines primers, polymerase and nucleotides needed for PCR into a single tablet. The specificity of a PCR assay is determined by the DNA sequences of the primers employed. The basis for primer design for the BAX System assay is a collection of 1572 strains of <i>L. monocytogenes</i> , which have been analyzed by ribotyping [8]. This large, well characterized culture collection has facilitated the design of primers that can detect all strains of <i>L. monocytogenes</i> , while remaining highly specific for <i>L. monocytogenes</i> and no other species.		

**PRINCIPLE OF THE METHOD Cont. (1)**

The product of the PCR reaction is automatically analyzed by fluorescent detection. Each PCR tablet contains fluorescent dye, which binds with double-stranded DNA and emits a signal in response to light. During the automated detection phase, the temperature of the samples is modified to denature the DNA, which releases the dye and changes the signal. These changes are measured, and the BAX System proprietary software analyzes that data to generate melting curves and determine a positive or negative result.

To perform the BAX System assay, the user begins with a two-stage enrichment of the food sample. An aliquot of the secondary enrichment is combined with a buffer containing a proteolytic enzyme, then heated to rupture the wall of the bacterial cells and release their DNA. The lysed mixture is used to hydrate a BAX System PCR tablet. The PCR process then selectively amplifies DNA from *L. monocytogenes*. Repeated cycles of denaturing, annealing and extending produce an exponential increase in the number of target DNA fragments, creating millions of copies within a matter of hours. If the target sequence is not present, no detectable amplification takes place. Results from this assay are available about 5 hours after enrichment, involving less than an hour of user time. Detailed instructions are included in the *User Guide* that is shipped with the instrument. Table 1 summarizes the process.

**DISCUSSION OF THE VALIDATION STUDY (1)**

The data in these studies, within their statistical uncertainty, support the product claims and demonstrate that the BAX system is comparable or superior to standard reference methods for detecting *L. monocytogenes* in a wide variety of foods.

**Table 2. BAX system inclusivity (1)**

**DISCUSSION OF MODIFICATION APPROVED DECEMBER 2015 (17)**

The comparison study demonstrated that the alternative method as performed using the X5 BAX instrument is equivalent to the USDA-FSIS, and FDA-BAM reference methods for the detection of *L. monocytogenes* from frankfurters, bagged spinach, queso fresco and plastic surfaces as determined by the specified AOAC statistical criteria. Inclusivity and exclusivity results were as expected with 100% inclusivity for target strains tested and 100% exclusivity for non-target strains tested. The test kit also demonstrated positive results across a wide titer of target in both pure culture and in enriched food matrix.

**Modification Data Approved December 2015 (17)****Table 2. Candidate method presumptive results vs. confirmed results – POD for food and environmental matrixes**

Matrix	Strain	MPN <sup>a</sup> /test portion	N <sup>b</sup>	Candidate method presumptive			Candidate method confirmed			dPOD <sub>CP</sub> <sup>f</sup>	95% CI <sup>g</sup>
				X <sup>c</sup>	POD <sub>CP</sub> <sup>d</sup>	95% CI	x	POD <sub>CC</sub> <sup>e</sup>	95% CI

<sup>a</sup>Most Probable Number is based on the POD of reference method test portions using the Least Cost Formulations MPN calculator (7), with 95% confidence interval.

<sup>b</sup>N = Number of test portions.

<sup>c</sup>x = Number of positive test portions.

<sup>d</sup>POD<sub>CP</sub> = Candidate method presumptive positive outcomes divided by the total number of trials.

<sup>e</sup>POD<sub>CC</sub> = Candidate method confirmed positive outcomes divided by the total number of trials.

<sup>f</sup>dPOD<sub>CP</sub> = Difference between the candidate method presumptive result and candidate method confirmed result POD values.

<sup>g</sup>95% CI = If the confidence interval of a dPOD does not contain zero, then the difference is statistically significant at the 5% level.
