

CERTIFICATION

AOAC Research Institute Performance Tested MethodsSM

Certificate No.

092301

The AOAC Research Institute hereby certifies the method known as:

Innovate[™] RapiScreen [™] Dairy Kit

manufactured by

Hygiena LLC 941 Avenida Acaso, Camarillo, CA USA

This method has been evaluated in the AOAC Research Institute *Performance Tested Methods*SM Program and found to perform as stated in the applicability of the method. This certificate indicates an AOAC Research Institute Certification Mark License Agreement has been executed which authorizes the manufacturer to display the AOAC Research Institute *Performance Tested Methods* SM certification mark on the above-mentioned method for the period below. Renewal may be granted by the Expiration Date under the rules stated in the licensing agreement.

Issue Date

December 6, 2023

CATALOG NUMBERS

KIT4001 Ref. no. 82050 (Innovate RapiScreen Dairy 5000 Test Kit), Kit 4000 Ref. no. 82010 (Innovate RapiScreen Dairy 1000 Test Kit), KIT4015 Ref. no. 1311250B

RapiScreen Dairy (25000) for Autosampler-Bar-Coded.

INDEPENDENT LABORATORY

Q Laboratories 1930 Radcliff Drive Cincinnati, OH 45204

REFERENCE METHODS

17th edition, 2004 (2)

American Public Health Association (APHA) Standard Methods for the Examination of Dairy Products (SMEDP) Chapter 6: Microbial Count Methods,

U.S. Food and Drug Administration (FDA) Bacteriological Analytical Manual (BAM): Chapter 3, Aerobic Plate count, U.S. Food and Drug Administration. April 2001. (3)

U.S. Food and Drug Administration (FDA) Bacteriological Analytical Manual (BAM): Chapter 16, Clostridium perfringens, U.S. Food and Drug Administration. April 2001. (4)

Compendium of Methods for the Examination of Food Products: Chapter 19: Lactic Acid Bacteria (no date) (5)

ISO 4833-1:2013 Microbiology of the food chain — Horizontal method for the enumeration of microorganisms — Part 1: Colony count at 30 $^{\circ}$ C by the pour plate technique (2019) ISO.

APPLICABILITY OF METHOD

Target organism - Mesophilic microorganisms.

Matrixes – ultra-high temperature (UHT) bovine milk, UHT plant-based drink (almond drink), half and half (10% fat), protein-based drink (casein), extended shelf life (ESL) plant-based drink (oat drink).

Performance claims – The study data were unable to detect a statistical difference in results between the Innovate System RapiScreen Dairy Kit and the culture-based reference methods. The method can reliably detect microbial contamination in 7 days, as compared to a 15-day reference method, and can detect contamination in some products in as few as 3 days.

ORIGINAL CERTIFICATION DATE September 11, 2023

METHOD MODIFICATION RECORD

1. November 2023 Level 2

CERTIFICATION RENEWAL RECORD

Renewed annually through December 2024.

SUMMARY OF MODIFICATION

 Manufacturing location change from Germany to California and a minor reformulation to Innovate RapiScreen Dary Kit components.

Under this AOAC *Performance Tested MethodsSM* License Number, 092301 this method is distributed by: NONE

Under this AOAC *Performance Tested Methods*SM License Number, 092301 this method is distributed as: NONE

PRINCIPLE OF THE METHOD (1)

The Innovate™ System is based on an automated benchtop luminometer capable of high throughput screening. The Innovate System works exclusively with the RapiScreen™ family. RapiScreen utilizes adenosine triphosphate (ATP) bioluminescence, where the luciferase enzyme catalyses the consumption of microbial ATP to produce light. ATP bioluminescence can detect viable microorganisms with high sensitivity, providing an objective result much faster, as compared to visible microbial growth on agar plates, resulting in a faster detection time. RapiScreen includes a sample treatment step to reduce non-microbial sources of ATP prior to performing the standard bioluminescence assay. A lysis step then releases microbial ATP for the bioluminescence reaction. The assay evaluated in this study is RapiScreen Dairy.

DISCUSSION OF THE VALIDATION STUDY (1)

The Innovate System luminometer using the RapiScreen Dairy Kit, is an easy and rapid way to detect the presence of microbial ATP in dairy and dairy alternative products. It is intended to be used to provide quicker results than standard plating methods. The Innovate System RapiScreen Dairy can reliably detect low concentrations of microbial ATP. The validation study confirmed that the Innovate System RapiScreen Dairy Kit can detect contaminated product packs in 7 days or less, depending on the product, with results that are equivalent to the 15-day reference method requirement.

Time to detection is based upon both the matrix type used and the growth rate of the organisms. The microorganism used in this study panel were stressed prior to inoculation, leading to the conclusion that healthy organisms could be detected quicker. In the inclusivity study, the Innovate System detected various types of microorganisms, including Gram-positive and Gram-negative bacteria, yeasts and moulds. The RLU signal varied between organisms due to differences in phenotype and growth rate. The method uses product-specific sterile RLU thresholds based on background ATP to determine when the organism has populated the sample. The method was able to detect all 50 inclusivity microbes at concentrations less than 5 x 10⁶ cfu/mL (2.7 x 10⁵ per 50 μL test aliquot) per container. Data obtained from matrix testing studies, which were closer to the designed use of the Innovate method than the inclusivity study, further supports this claim. For all tested matrixes, the Innovate System RapiScreen Dairy method produced a 100% detection rate for the high positive spike level, low fractionally positive results (5–15 positives) and negative results for the control containers. The Innovate System method was at least twice as fast, when 7-day incubation is considered, when compared to the 15-day result of the reference methods.

In order to optimise the probability of contamination detection, the Innovate method must be validated for the specific product and incubation period for the most likely microbial contaminants. The customer might also choose to validate an incubation period shorter than 7 days, as a shorter period might be sufficient to detect high and/or fractional contaminants in certain matrixes. All positive results on the Innovate System method were significantly above the threshold obtained from the matrixes' RLU baselines. Based on this study, the Innovate System using RapiScreen Dairy Kit detected microbial contaminants in the examined matrixes at least 10 days quicker than the reference method for the matrixes.

The Independent Matrix Study performed with the Innovate System RapiScreen Dairy Kit further substantiates the claim, having achieved successful detection of microbial contamination in UHT bovine milk at and after 24 h of incubation. Using POD analysis, no statistically significant differences were observed between the number of positive samples detected by the candidate method and the reference methods for all samples tested after 24 h of incubation. The RapiScreen Dairy Kit combined with the Innovate System luminometer instrument and software provides a simple and rapid method for determining the commercial sterility of manufactured products. The reagents are easy to prepare by adding a bottle of diluent to a bottle of lyophilized reagent. The software is intuitive and allows for ease of use of the Innovate System instrument. Cleaning and maintaining the Innovate System instrument is convenient as the instrument has a self-cleaning wash feature.

Further studies of robustness, instrument variation, product consistency and stability all achieved the required fractional levels of between 3 and 7 positives out of 10 and showed detection to be consistent across all conditions, independent of the examined organisms or variables introduced to the condition. Hence, the Innovate System method is sensitive and robust, with the RapiScreen Dairy Kit reagents performing consistently across their shelf life. The Instrument Variation study detected no variation in performance across three different luminometers that could affect the detection of a contaminant.

DISCUSSION OF MODIFICATION APPROVED NOVEMBER 2023 (6)

The Innovate System luminometer using the RapiScreen Dairy Kit, is an easy and rapid way to detect the presence of microbial contamination in dairy and dairy alternative products. This detection method has been certified by AOAC-RI PTM program (Cert. No. 092301) for 5 claimed matrixes, UHT bovine milk, UHT plant-based drink (almond drink), half and half 10% fat, protein-based drink, ESL plant-based drink (oat drink). The Level 2 modification described here was conducted due to the shift from third-party to inhouse manufacturing, and to conform to US-specific chemical regulations. The candidate method is intended to be used to provide quicker results than standard plating methods. The Innovate System RapiScreen Dairy can reliably detect low concentrations of microbial contamination. The validation study confirmed that the Innovate System RapiScreen Dairy Kit delivers detection of contaminated product packs in 5–7 days with results that are equivalent to the 15-day reference method.

Time to detection is based upon both the matrix type used and the growth rate of the organisms. The microorganisms used in this study panel were stressed prior to inoculation, leading to the conclusion that healthy organisms would be detected quicker. In the inclusivity study, the Innovate System detected various types of microorganisms, including Gram-positive, Gram-negative bacteria, yeasts, and moulds. The RLU signal varied between organism types due to differences in phenotype and growth rate. The method uses product specific sterile RLU thresholds based on background ATP to determine whether the organism has populated the sample. The method was able to detect all 50 inclusivity microbes tested in this study.

Data obtained from matrix testing studies, which were closer to the designed use of the Innovate method than the inclusivity study, further supports this claim. For all tested matrixes, the Innovate System RapiScreen Dairy method produced a 100% detection rate for the high positive spike level, low fractionally positive results (5–15 positives) and negative results for the control containers. The Innovate System method was more than twice as fast, when 5-day incubation is considered, when compared to the 15-day result of the reference methods. At 5 days, fractional equivalence occurred in half and half. Both ESL plant-based drink and protein-based drink gave fractional results after 7days of incubation (all incubations are at 30°C).

In order to optimise the probability of contamination detection, the Innovate method must be validated for the specific product and incubation period for the most likely microbial contaminants.

Based on this study, the Innovate System using RapiScreen Dairy Kit detected microbial contaminants in the examined matrixes at least 7 days quicker than the reference method.

The RapiScreen Dairy Kit combined with the Innovate System luminometer instrument and software provides a simple and rapid method for determining the commercial sterility of manufactured products. The reagents are easy to prepare by adding a bottle of diluent to a bottle of lyophilized reagent. The software is intuitive and allows for easy use of the Innovate System instrument. Cleaning and maintaining the Innovate System instrument is convenient as the instrument has a self-cleaning wash feature.

Further studies of robustness, instrument variation, product consistency and stability all achieved the required fractional levels of between 3 and 7 positives out of 10 and showed detection to be consistent across all conditions, independent of the examined organisms or variable introduced to the condition. Hence, the Innovate System method was sensitive and robust, with the in-house manufactured RapiScreen Dairy Kit reagents performing consistently across the product shelf-life. The Instrument Variation study detected no variation in performance across three different luminometers that could affect the detection of a contaminant.

eSample aliquot is 50 μL

^b N = number of test portions.

^c X = number of positive test portions.

^d POD_C = Candidate method presumptive positive results confirmed positive divided by the total number of trials.

^e POD_R = Reference method results divided by the total number of trials.

fdPOD_C = Difference between the candidate method and reference method POD values.

^{895%} CI = if the confidence interval of a dPOD does not contain zero, then the difference is statistically significant at the 5% level.

^h ATCC = American Type Culture Collection, Manassas, VA.
