

CERTIFICATION

AOAC Research Institute *Performance Tested Methods*SM

Certificate No.
030502

The AOAC Research Institute hereby certifies the method known as:

BAX[®] System PCR Assay for Genus *Listeria*
BAX[®] System X5 PCR Assay for Genus *Listeria*

manufactured by

Hygiena
2 Boulden Circle
New Castle, DE 19720
USA

This method has been evaluated in the AOAC Research Institute *Performance Tested Methods*SM Program and found to perform as stated in the applicability of the method. This certificate indicates an AOAC Research Institute Certification Mark License Agreement has been executed which authorizes the manufacturer to display the AOAC Research Institute *Performance Tested Methods*SM certification mark on the above-mentioned method for the period below. Renewal may be granted by the Expiration Date under the rules stated in the licensing agreement.

A handwritten signature in black ink that reads "Scott Coates".

Scott Coates, Senior Director
Signature for AOAC Research Institute

Issue Date	December 19, 2023
Expiration Date	December 31, 2024

AUTHORS

ORIGINAL VALIDATION: F. Morgan Wallace, Peter M. Mrozinski, George Tice, Bridget Andaloro, H. Kirk White, Eugene Davis, and L. Winona Wagner

MODIFICATION JULY 2008: George Tice, Bridget Andaloro, Eugene Davis, Siqun Wang, Pheakdey Ith, and F. Morgan Wallace

MODIFICATION JULY 2013: Steve Hoelzer, F. Morgan Wallace, Lois Fleck, Deana DiCosimo, Jacqueline Harris, Bridget Andaloro, Andrew Farnum, Eugene Davis, and Jeff Rohrbeck

MODIFICATION JANUARY 2016: Jeff Rohrbeck, Alain Minelli, Eugene Davis, Gongbo Wang, Lois Fleck, Steven Hoelzer, Dawn Fallon, and Morgan Wallace

APPLICABILITY OF METHOD

Target organism – *Listeria* species.

Matrixes – (swab, 1 x 1 in) – Cast Iron, Plastic, Air Filter Material, Unpainted wood, drain swabs

(sponge, 4 x 4 in) – Ceramic tile, Sealed Concrete, rubber, Painted wood surfaces

July 2008 Modification – USDA-FSIS – frankfurters, and environmental sponges

FDA BAM 10 – spinach, smoked salmon

AOAC 993.12 – processed cheese

MODIFICATION JANUARY 2016 – MLG 8.09 – frankfurters, stainless steel (4 x 4 in sponge), plastic (4 x 4 in sponge)

FDA BAM Ch.10 – bagged spinach and queso cheese

Performance claims – Sensitivity equivalent to the respective reference methods.

PRINCIPLE OF THE METHOD (1)

PCR amplification - The BAX® system uses the Polymerase Chain Reaction (PCR) to amplify a specific fragment of bacterial DNA, which is stable and unaffected by growth environment. The fragment is a genetic sequence that is unique to the genus *Listeria*, thus providing a highly reliable indicator that the organism is present. The BAX system simplifies the PCR process by combining the requisite primers, polymerase and nucleotides into a stable, dry, manufactured tablet already packaged inside the PCR tubes. After amplification, these tubes remain sealed for the detection phase, thus significantly reducing the potential for contamination with one or more molecules of amplified PCR product.

Fluorescent detection - The automated BAX system uses fluorescent detection to analyze PCR product. Each PCR tablet contains a fluorescent dye, which binds with double-stranded DNA and emits a signal in response to excitation light. During the detection phase, the temperature of the sample is slowly increased to denature the DNA, which in turn, releases the dye and causes a drop in emission signal. The BAX system measures the denaturation temperature and analyzes the magnitude of the fluorescent signal change to determine a positive or negative result.

DISCUSSION OF THE ORIGINAL VALIDATION STUDY (1)

Results from the method comparison studies demonstrate BAX system performance that is equivalent to the reference methods for detection of *Listeria species* from environmental surfaces with the exception of stainless steel.

The inclusivity/exclusivity study showed 100% agreement (when excluding *L. grayi* strains) and 97.2% when *L. grayi* is included with expected results for the test panel. As DNA sequence based typing schemes of *Listeria* indicate that *L. grayi* clusters distantly from all other species of *Listeria* (9), debate as to whether it is truly a *Listeria* species is ongoing within the bacterial taxonomy community. Other phenotypic and genotypic studies have also raised questions as to whether *L. grayi* should be included in the genus *Listeria* or placed in a new genus, *Murraya* (12).

a Figures in parenthesis are the number of assays which are BAX® assay positive for which culture confirmation was successful

b Figure represents the number of enrichments from which a confirmed *Listeria* isolate was recovered (therefore if there were 4 confirmed BAX® positive enrichments and 5 culture positive enrichments there was 1 false negative for that treatment)

^c 6.5 X 10⁵ cfu *Pseudomonas aeruginosa* added to each plot as competitive flora

^d 2.5 X 10⁵ cfu *Pseudomonas aeruginosa* added to each plot as competitive flora

e Results from rtech do not support a claim of equivalence, therefore this surface is not included in the AOAC validated product claim.

DISCUSSION OF MODIFICATION JULY 2008 (3)

No statistically significant differences were obtained when comparing the BAX® test kit and the appropriate reference method for any of the studies performed. Chi-square values calculated for these studies ranged from 0.10 to 1.26 (with a value of > 3.84 indicative of significance at the 95% confidence level) demonstrating that the test and reference methods performed in an indistinguishable manner. All BAX® positive results were able to be confirmed by culture, and none of the BAX® negative samples were positive by culture, thus no false negative or false positive results were obtained by the test method. Sensitivity and specificity were thus 100% for all matrixes tested. For naturally occurring flora from smoked salmon and environmental sponges, a wide variety of species were isolated as determined by Micro-ID *Listeria* characterization.

All indeterminate (*Listeria monocytogenes/innocua* Micro-ID *Listeria* code 44044) results resolved as *L. monocytogenes* upon characterization with the Riboprinter™ for salmon derived isolates. The environmental sponge samples also were positive for a diverse population of *Listeria* species, but were not subjected to molecular subtyping at the request of the provider of the samples.

DISCUSSION OF MODIFICATION JULY 2013 (6)

The results of the method comparison between the digital DuPont Thermal Block and the analog heating/cooling blocks are provided in Table 3 below. For all sample types and BAX System assays evaluated, the results for samples processed with the DuPont™ Thermal Block and the original heating/cooling blocks demonstrated no significant statistical difference as indicated by POD analysis (the 95% confidence interval of the dPOD included 0 in all cases). For additional figures illustrating the target responses of the individual BAX System assays, see Appendix B.

All 544 samples inoculated with high levels of the target organism returned positive results with the BAX System using both sample preparation methods, and all 544 samples tested as unspiked negative controls returned negative results with the BAX System using both sample preparation methods with the exception of the non-inoculated poultry rinse samples that gave positive results for *Campylobacter jejuni*, while giving negative results for the target *C. coli* that was spiked into the test samples. For samples inoculated with low levels of target organism, the two preparation methods returned identical results for 530 of the 544 samples tested. The results for the 14 samples that returned different results between the two methods are summarized in Table 3. Because the low-spike samples were tested at levels near the limit of detection for the BAX® System assays, some discrepancy between the two methods is expected based on factors such as the distribution of the target organism within the sample.

Analysis of target response in cases where a fractional response was not generated, while demonstrating significant differences from a statistical standpoint in some cases, were not indicative of any difference that would likely be significant in a practical sense. All average differences were less than 10% for melt curve based target peak height, or target peak area to target plus internal control peak areas (for the Yeast and Mold assay) and all average C_t differences were less than 1 for all real time assay.

Because the difference in results between the two methods demonstrated no significant statistical difference as indicated by the POD analysis, these differences are found to be acceptable in this study for demonstrating equivalency between the two methods.

DISCUSSION OF MODIFICATION JANUARY 2016 (7)

The comparison study demonstrated that the alternative method as performed using the X5 BAX® instrument is equivalent to the USDA-FSIS, and FDA-BAM reference methods for the detection of *Listeria* spp. from frankfurters, bagged spinach, queso fresco and plastic and stainless steel surfaces as determined by the specified AOAC statistical criteria. Inclusivity and exclusivity results were as expected with 100% inclusivity for target strains tested and 100% exclusivity for non-target strains tested. The test kit also demonstrated positive results across a wide titer of target in both pure culture and in enriched food matrix.

Modification Data Approved January 2016 (7)

^bN = Number of test portions.

^cx = Number of positive test portions.

^dPOD_{CP} = Candidate method presumptive positive outcomes divided by the total number of trials.

^ePOD_{CC} = Candidate method confirmed positive outcomes divided by the total number of trials.

^fdPOD_{CP} = Difference between the candidate method presumptive result and candidate method confirmed result POD values.

^g95% CI = If the confidence interval of a dPOD does not contain zero, then the difference is statistically significant at the 5% level.

^h*C. freundii* was applied at levels targeting 10 X the *Listeria* level. For the high level samples this was 9 X 10⁵ CFU/mL and for the fractional level samples this was 9 X 10⁴ CFU/mL.

Table 3. Method comparison results - POD for food and environmental matrixes (7)
